Bandom point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligomoucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which cocurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        890 CCTGCCAGACCCGCCGAAGAAGCCACCTCTTTGGAGGGTGCGCTCCTTGGCACGCGCAC 949

generic sequences are shown in 070465-68. Other specific peptides

generated by these generic sequences are shown in R65150-54. TSARS are
concatenated heterofunctional proteins or peptides, comprising at least
two functional regions - a binding domain with affinity for a ligand and
a second effector peptide portion that is chemically or biologically
active. They may further comprise a linker peptide between the 2 domains.

The oligonucleotides are also designed so that the expressed peptide
contains 2 or 4 cysteine residues positioned in, or flanking, the
unpredicted or variant residues. These residues confer some degree of
conformational rigidity to the peptides. The TSARS or comparising
a TSAR binding domain can be used in vivo to deliver a chemically or
biologically active moiety, eg. metal ion, radioisotope, peptide, toxin
c renzyme, to the specific target or on the cell. They can also replace
the function of macromolecules, eg. monoclonal or polyclonal antibodies
and therefore circumvent the need for complex methods of hybridoma
formation or in vivo antibody production. The TSARs are easily
detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Terebash rost-tier.

Tentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain.

Screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain.

Solution and the sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1(TGC)(NNB)5(Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with a filinity for a ligand and a second effector peptide portion that is chemically or biologically active they may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              150 recedences and reconstance and reconstance reconstance and reconstance rec

CQ 0465 is a generic DNA Sequence used to generate random TSAR (Totally

CG 070465 is a generic DNA Sequence used to generate can also be

represented as follows: x(NNB) [GGC) (NNB) 112 (NNB) 14 (TGC) (NNB) 3Y. x

and Y are flanking restriction sites (X is not the same as Y) that are

CC and Y are flanking restriction sites (X is not the same as Y) that are

CC other specified further. Other generic sequences are shown in Q70466-68.

CO ther specified further or generic sequences are shown in CR65151-54. TSARs are concatenated by these generic sequences are shown in

CR65151-54. TSARs are concatenated beterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with

CC affinity for a ligand and a second effector peptide portion that is

CC chartly for a ligand and a second effector peptide portion that is

CC that the expressed peptide contains 2 or 4 cysteine residues positioned

CI no or flanking, the unpredicted or variant residues. The TSARS

CC confer some degree of conformational rigidity to the peptides. The TSARS

CC confers comprising a TSAR binding domain can be used in vivo to

Cdelliver a chemically or biologically active moiety, eg. metal ion,

C addioisotope, peptide, toxin or enzyme, to the specific target or on the

CC cell. They can also replace the function of macromolecules, eg.
that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   152 GGGGGCCTGGGGCCCCAAGGGCTGGCGGCTGGTGCAGCGCGGGGGACCCGGCGGCTTTCCGC 211

Tentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; Page 35: 255pp English and in a frector domain bisclosure; Page 35: 255pp English and in a frector domain bisclosure; Page 35: 25pp English and in a factor formula can also be represented as follows: X(NNB) 6(TGC)(NNB)112(NNB)14(TGC)(NNB)3Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specified further of the specified for a ligand as a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in or flanking the unpredicted or variant residues positioned in or flanking a flower some degree of conformational rigidity to the peptides. The TSARS conformation of the specified or the specified and the standard and a second effector peptides. The TSARS conformation of the specified or variant residues. The TSARS conformation or the specified or the specified compans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or composis. comprising a TSAR binding accomann can we used a deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                         ö

PT Identifying proteins or peptide(s) which bind a ligand - by

Screening a recombinant vector library expressing fusion proteins

PT Comprising a binding domain and an effector domain

Disclosure; Page 35; 255pp; English .

COMPAGE is a generic DNA sequence used to generate random TSAR (Totally Spinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1/(TCC)(NNB)2/(TCC)(NNB)100; X and Y are flanking restriction sites (X is not the same as Y) that are cont specified further. Other generic sequences are shown in 707046-68.

CC offers specific peptides generated by these generic sequences are shown in 85151-54. TSARs are concatenated heterofunctional proteins or peptides, CO ther specific peptides generated by these generic sequences are shown in 85151-54. TSARs are concatenated heterofunctional proteins or peptides, CO comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of faming, the unpredicted or variant residues. These residues to that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rapidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to confers some degree of conformation or enzyme, to the specific target or on the conformation or polyclonal antibodies and therefore circumvent the need conformation and rapid detection in a screening process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              rdentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

C70467 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)[GTGC](NNB)12(NNB)16(TGC)(NNB)12, X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Cher specific peptides generated by these generic sequences are shown in R5151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with the chancally or biologically active. They may further comprise a linker the light between the 2 domains. The oligonucleotides are also designed so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromalecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Generic DNA sequence to generate a random TSAR petide library. Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins PT Genering a recombinant vector library expressing fusion proteins PT comprising a bluding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

CT G704(69 is a generic DNA Sequence used to generate random TSAR peptide CT This generic Cormula can be represented as follows; KTGC)(NNB)10-CT GTGC)(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction sites (X is not the same as Y) that are not specified further. This scapuence generates peptides that are cloverleaf in structure. Other corrected by these generic sequences are shown in Q70455-68. Other specific peptides

CC Generated by these generic sequences are shown in M70455-68. Other specific peptides

CC Generated by these generic sequences are shown in A70455-69. Other specific peptides

CC Generated by these generic sequences are shown in A70455-69. Other specific peptides

CC Generated by these generic sequences are shown in A70455-69. Other a ligand and a second effector peptide portion that is chemically or biologically or biologically are also designed so that the expressed peptide

CC concatains 2 or 4 cysteine residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsens. Comprising a TSAR binding domain can be used in vivo of celliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or engage in vivo antibody production. The TSARs are easily conformated in a screening process.

CC Characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3572 GCGGTGCGGGCCTGGGTGTGGGCCGCCCCTCCCTCGGGACGTAGAGCCCGGCGTGAC 3513
                            Generic DNA sequence to generate a random TSAR peptide library.
TSAR: totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct: rapid; detection; screening; treatment; generic; ss.
Synthetic.

Subject Claim 5; Page 38; 71pp; English.

Claim 5: Page 38; 71pp; English.

C A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithalium of the free antisense oligonucleotide specific of the human endothelio-1, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchits and other caliway diseases characterised by an inflammatory response. By climinating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-continuous antisense degradation in patients with hyper-reactive airways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                            A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonuclectide specific for the human endothelin-1, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
